What is Coronavirus (COVID-19)

David Anderson - World Health Organisation

# Introduction

- 31 December 2019, the World Health Organization (WHO) China country office reported a cluster of pneumonia cases in Wuhan, Hubei Province of China
- 7 January 2020, causative pathogen identified as a novel coronavirus (2019-nCoV)
- Initially person-to-person transmission not apparent and the majority of the cases were epidemiologically linked to a seafood, poultry and live wildlife market (Huanan Seafood Wholesale Market) in Jiangnan District of Hubei Province
- Case in China are now declining but there is a rapid increase in Europe and Iran.
- Cases now in Africa

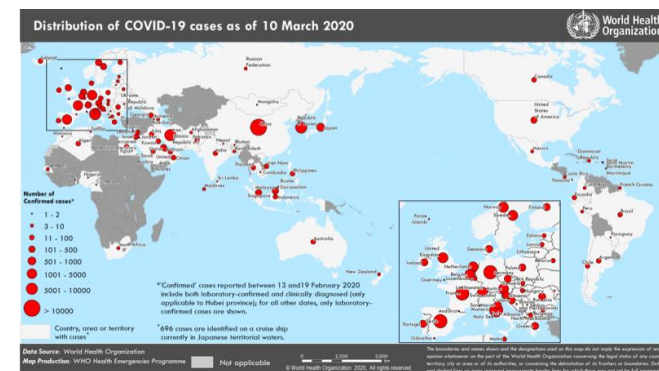

Figure 2. Epidemic curve of confirmed COVID-19 cases reported outside of China (n=32 778), by date of report and WHO region through 10 March 2020

# Microbiology

- Coronaviruses are enveloped, single-stranded positive-sense RNA viruses.
- The envelope of the coronaviruses is covered with club-shaped glycoproteins which look like 'crowns', or 'halos' – hence the name 'coronavirus.'
- Coronaviruses are responsible for the common cold, and usually cause self-limited upper respiratory tract infections.

# Where did it come from?

- In 2003, a new coronavirus emerged leading to the SARS (severe acute respiratory syndrome) outbreak.
- In 2012, the Middle East respiratory syndrome (MERS) was found to be caused by a coronavirus associated with transmission from camels.
- Following the identification of a cluster of pneumonia cases in Wuhan, Hubei Province of China, Chinese authorities reported on 7 January 2020 that the causative pathogen was identified as a novel coronavirus (2019-nCoV).
- These new coronaviruses have RNA sequences that are very similar to coronaviruses from animals
  - MERS-CoV = camel coronavirus
  - SARS = bat coronavirus
- The animal source of COVID-19 has not been identified but is thought to be bats

World Health  
Organization

# How does it Spread (transmission)

- Main route of transmission respiratory droplets (airborne transmission has not been proven)
- Excreted in stool (possibly faeco-oral) recent studies show that it is not viable
- Mean incubation period 5.2 days, 95th percentile of the distribution at 12.5 days.
- 14 days of isolation or quarantine is suggested as it allows a window of 1.5 additional days.
- In early stages, epidemic doubled in size every 7.4 days
- Basic reproductive number was estimated at 2.2 on average each infectious case gives rise to just over 2 infectious cases.

# Clinical presentation

World Health  
Organization

## Who is at highest risk?

- Largest published series to date from China
- Patients with pneumonia the commonest symptoms were fever (83%), cough (82%) and shortness of breath (31%).
- The majority (but not all) of severe cases are elderly or have severe underlying illness
- Among pneumonia patients 51% had chronic diseases
- Health issues which make you more susceptible smoking and hypertension
- The elderly with other health problems

## Number of cases and continue to increase

- 84% of cases a mild and recover at home
- 16% require hospitalisation and a small amount require ITU (4%)
- Approximately 2% of reported confirmed cases have died

# Signs and Symptoms of Coronavirus

Patients with COVID-19 have experienced mild to severe respiratory illness.

Symptoms\* can include

FEVER

COUGH

\*Symptoms may appear 2-14 days after exposure.

Seek medical advice if you develop symptoms, and have been in close contact with a person known to have COVID-19 or if you live in or have recently been in an area with ongoing spread of COVID-19.

SHORTNESS OF BREATH

World Health

# How do I help prevent the spread of Diseases like Coronavirus?

- Avoid close contact with people who are sick
- Cover you nose and mouth with a tissue when you cough or sneeze and then BIN the tissue
- Avoid touching your eyes, nose and mouth
- Clean and disinfect frequently touched objects and surfaces
- Stay at home when you are sick, except to get medical care
- Wash your hands often with soap and water for at least 20 seconds

## Help prevent the spread of respiratory diseases like COVID-19.

Avoid close contact with people who are sick.

Cover your cough or sneeze with a tissue, then throw the tissue in the trash.

Clean and disinfect frequently touched objects and surfaces.

Avoid touching your eyes, nose, and mouth.

Stay home when you are sick, except to get medical care.

Wash your hands often with soap and water for at least 20 seconds.

# "Social" Hand Washing

1 Rub hands palm to palm

2 right palm over left dorsum with interlaced fingers and vice versa

3 palm to palm with fingers interlaced

4 backs of fingers to opposing palms with fingers interlocked

5 rotational rubbing of left thumb clasped in right palm and vice versa

6 rotational rubbing, backwards and forwards with clasped fingers of right hand in left palm and vice versa
